Cu-ETP | C11000 | CW004A

Electrolytic tough-pitch copper (Cu-ETP) is the standard oxygen containing pure copper grade. It is very commonly used for electronics and electric engineering components in cases that high conductivity (100 % IACS) is requested and mechanical strength may be low. Typical applications of Cu-ETP strip are stamping parts, transformer coils, cable strip and heat sinks.

Thermal stress relaxation

Stress remaining after thermal relaxation as a function of Larson-Miller parameter P
(F. R. Larson, J. Miller, Trans ASME74 (1952) 765–775) given by:
 $P = (20 + \log(t)) * (T + 273) * 0.001$.
Time t in hours, temperature T in °C.
Example: P = 9 is equivalent to 1,000 h/118 °C.
Measured on rolled to temper specimens parallel to rolling direction.
Total stress relaxation depends on the applied stress level.
Furthermore, it is increased to some extent by cold deformation.

Fatigue strength

The fatigue strength is defined as the maximum bending stress amplitude which a material withstands for 10^7 load cycles under symmetrical alternate load without breaking. It is dependent on the temper tested and is about 1/3 of the tensile strength R_m .

Softening resistance

Vickers hardness after heat treatment

Types and formats available

- Standard coils with outside diameters up to 1,400 mm
- Traverse-wound coils with drum weights up to 1.5 t
- Multicoil up to 5 t
- Hot-dip tinned strip
- Contour-milled strip

Dimensions available

- Strip thickness from 0.10 mm, thinner gauges on request
- Strip width from 3 mm, however min. 10 x strip thickness
